SF1685: Calculus

Linear differential equations

Lecturer: Per Alexandersson, perale@kth.se

Linear differential equations

A (homogeneous) linear differential equation can be expressed in the form

$$y^{(n)} + c_{n-1}y^{(n-1)} + \cdots + c_2y'' + c_1y' + c_0y = 0.$$

General second-degree differential equation

Let $p, q \in \mathbb{R}$, and lets consider

$$y'' + \underline{p}y' + \underline{q}y = 0.$$

Now, suppose α and β are two *different* roots of $t^2 + pt + q = 0$ (characteristic equation).

Claim: $e^{\alpha x}$ and $e^{\beta x}$ are solutions, and the general solution is

$$Ae^{\alpha X} + Be^{\beta X}, \qquad A, B \in \mathbb{R}$$

We check:

$$D^{2}[e^{\alpha x}] + pD[e^{\alpha x}] + qe^{\alpha x} = \alpha^{2}e^{\alpha x} + p\alpha e^{\alpha x} + qe^{\alpha x}$$
$$= e^{\alpha x} \left(\underline{\alpha^{2} + p\alpha + q} \right) = 0$$

And what do we know about $\alpha^2 + p\alpha + q$?

Two questions: First, what if the roots are complex?

Suppose $\alpha = a \pm ib$ are the two roots. Then

$$e^{(a+ib)x}$$
 and $e^{(a-ib)x}$

are solutions. But, by the argument last class, so are

$$e^{(a+ib)x} + e^{(a-ib)x}$$
 and $e^{(a+ib)x} - e^{(a-ib)x}$

Now.

abservation

$$e^{(a+ib)x} + e^{(a-ib)x} = e^{ax} \left(e^{ibx} + e^{-ibx} \right)$$

$$= e^{ax} \left(\cos(bx) + i \sin(bx) + \cos(bx) - i \sin(bx) \right)$$

$$= 2e^{ax} \cos(bx).$$

Same manne: 2ex. SM(bx) is also a solution.

In conclusion

We want to solve y'' + py' + qy = 0. If the characteristic equation $t^2 + pt + q = 0$ has the complex roots $a \pm ib$, then the general (real) solution is of the forms

$$Ae^{ax}\cos(bx) + Be^{ax}\sin(bx)$$

where $A, B \in \mathbb{R}$.

Second question: What if we have a double root?

We want to solve y'' + py' + qy = 0. If the characteristic equation $t^2 + pt + q = 0$ has the *double root* ρ , then the general solution is of the forms

$$(A + Bx)e^{\rho x}$$

where $A, B \in \mathbb{R}$.

Similar theory for hiser degree exactions

E. J.
$$y''' + 3y'' + 3y' + y = 0$$

Consider: $t^3 + 3t^2 + 3t + 1 = 0$ ($t+13=0$, tiple

Solutions are $(A+B\times+(\times^2)e^{-X})$

Some typical questions I

Question

Find the solution to y'' + 5y' + 6y = 0 which satisfies y(0) = 1, y'(0) = 2.

First ansider £2+5++6=0. This eq. hastle roots -2 and -3.

Thus $5 = A \cdot e^{-2x} + B e^{-3x}$ is the several solution. $5 = -2Ae^{-2x} - 3Be^{-3x}$

we want 5(0)=1, so A+B=1, and y'(0)=2, so -2A-3B=2.

Solve: { A+B=1 } A=5 (0 -B=4 => 1 B=-4.

Findly, 9=5.e-2x_4e-3x is the solution ne

Some typical questions II

Question

Find the solution to y'' - 4y' + 4y = 0 which satisfies y(0) = 1, y'(0) = 4.

The seneral solution is
$$S = (A + B \times) \cdot e^{2x}$$
.
 $S' = 2 + e^{2x} + B \cdot e^{2x} + 2B \times \cdot e^{2x}$
Bel cons: $S(S) = 1 \Rightarrow A = 1$
 $S'(S) = 4 \Rightarrow 24 + TS = 4$, so $TS = 2$.

Some typical questions II

Question

Find the solution to y'' + 2y' + 10y = 0 which satisfies y(0) = 2, y'(0) = 7.

Consider
$$\vec{\xi} + 2t + |0=0|$$
, $t = -\frac{7}{2} \pm \sqrt{1-10^7}$.
So, $-1\pm 3i$ are the solutions.

The several solution is
$$y = e^{-x} (A \cos 3x + B \sin 3x)$$

 $y' = -e^{-x} (A \cos 3x + B \sin 3x) + e^{-x} (-3A \sin (5x) + 3B \cos (3x))$
Now, $y(0) = 2 \Rightarrow e^{0} (A \cos (0) + B \sin (0)) = 2 \Rightarrow A = 2$
 $y'(0) = 7, = -A + 3B = 7 \Rightarrow B = 3$

Inhomogeneous equations

What if we want to solve

$$y'' + 5y' + 6y = 6x + 11$$
, $y'' + 5y' + 6y = 6e^{-x}$, $y'' - 3y' + 2y = 5\sin(2x)$
 $5 = 4 \times +5$ $5 = 4 \times -2$ $5 = 4 \times -2$

The idea is to first find the **general solution**, y_h , to the **homogeneous equation**, y'' + 5y' + 6y = 0, first, and then find a **particular solution**, y_p . Then, the solution we seek is $y := y_h + y_p$.

So how do we find y_p ?

Make an anzats, which is similar-looking to the right-hand side.

Question

Find the solution to y'' + 5y' + 6y = 6x + 11 which tangents the line 7x + 2 at the origin.

The solution to the home extris
$$y_1 = Ae^{-2x} + Be^{-3x}$$
.

Now, we space $y_2 = ax + b$,

 $y_4 = a$, so $5a + 6(ax + b) = 6x + 11$.

We need that $6ax = 6x$ and $5a + 6b = 11$
 $3a = 1$

Thence, $y_2 = x + 1$ and $y_3 = x + 1 + Ae^{-2x} + Be^{-3x}$ is the scansol.

Thence, $y_4 = x + 1$ and $y_5 = x + 1 + Ae^{-2x} + Be^{-3x}$ is the scansol.

Thence, $y_4 = x + 1$ and $y_5 = x + 1 + Ae^{-2x} + Be^{-3x}$ is the scansol.

Question

Find the solution to $y'' + 5y' + 6y = 6e^{-x}$ which satisfies $y'' + 5y' + 6y = 6e^{-x}$ which satisfies $y'' + 5y' + 6y = 6e^{-x}$ which satisfies $y'' + 5y' + 6y = 6e^{-x}$ and y(0) = 2.

As blore, On = Ae-7x + Be-3x Now, ansite, y== C.e-x Si=-cex, so c.ex + 6.cex + 6.cex = 6.ex [Sp=c.ex, not sent] => 2.L=6, so L=3. Hama, 50=3. ex, and 9=3. ex+Ae-2x+Be-3x Solve now for A and B: 5105=2: 13+A+13=2 5'(0)=0: 1-3-24-315=0 ... 50/4!

Question

Find the solution to $y'' - 3y' + 2y = 5\sin(2x)$ which satisfies y(0) = y'(0) = 0.

Gen. S): 5= Aer +13ex + & Siy(2x) - 3/4 Los(2x), And B.

Side track — More linear algebra?

Let u(x) be an unknown function, such that u'' - 3u' + 2u = 0. Introduce v(x) := u'(x). Then,

$$\underline{v'(x)} = u''(x) = 3u' - 2u = \underline{3v - 2u}.$$

In matrix format.

$$\frac{v'(x)}{v'(x)} = u''(x) = 3u' - 2u = 3v - 2u.$$

$$\frac{A}{(u'(x))} = \begin{pmatrix} 0 & 1 \\ -2 & 3 \end{pmatrix} \begin{pmatrix} u(x) \\ v(x) \end{pmatrix}.$$

$$\frac{A}{(u'(x))} = \begin{pmatrix} 0 & 1 \\ -2 & 3 \end{pmatrix} \begin{pmatrix} u(x) \\ v(x) \end{pmatrix}.$$

$$\frac{A}{(u'(x))} = \begin{pmatrix} 0 & 1 \\ -2 & 3 \end{pmatrix} \begin{pmatrix} u(x) \\ v(x) \end{pmatrix}.$$

$$\frac{A}{(u'(x))} = \begin{pmatrix} 0 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} u(x) \\ v(x) \end{pmatrix}.$$

$$\frac{A}{(u'(x))} = \begin{pmatrix} 0 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} u(x) \\ v(x) \end{pmatrix}.$$

$$\frac{A}{(u'(x))} = \begin{pmatrix} 0 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} u(x) \\ v(x) \end{pmatrix}.$$

$$\frac{A}{(u'(x))} = \begin{pmatrix} 0 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} u(x) \\ v(x) \end{pmatrix}.$$

$$\frac{A}{(u'(x))} = \begin{pmatrix} 0 & 1 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} u(x) \\ v(x) \end{pmatrix}.$$
